

## Understanding Rwanda's Export Sector

### In brief

- This policy brief analyzes export dynamics in Rwanda, with a focus on if and how firms in Rwanda have acquired the capabilities to export to new destinations, discover new products and improve their productivity levels.
- Rwanda's domestic market is small and cannot create demand to drive sustained rapid production growth. Rwanda must aim to expand and upgrade its exports.
- Rwanda's non-commodity export sector remains small, but the number of firms exporting is increasing rapidly and these are mainly to neighbouring markets (in 2012, 72% of non-commodity exports went to the EAC and the DRC).
- While destination discovery is limited, product discovery has contributed between 15-20% to exports growth over the past decade.
- Expanding Rwanda's non-commodity exports requires:
  - Creating a supportive environment for larger groups.
  - Engaging leading exports on a regular basis to determine policy, institutional, economic barriers they encounter
  - Facilitate the creation of more efficient and effective supply chains for raw materials through information, coordination efforts and infrastructure investments.

*This policy brief stems from the "Learning to Compete" research initiative undertaken in Rwanda to explore learning-by-exporting in the formal non-services export sector.*

This policy brief presents a broad policy-centered approach to analyze export dynamics in Rwanda, with a focus on if and how firms in Rwanda - and Rwanda's exports sector as a whole - have acquired the capabilities to export to new destinations, discover new products and improve their productivity levels to better compete on regional and international export markets. The building blocks of the approach can be narrowed down to three units of interest: firms, products and destinations. Rwanda's domestic market is small and cannot create sufficient demand to drive sustained rapid growth in production. In order to grow, Rwanda must aim to expand and upgrade its exports. In the past few years, Rwanda's exports have experienced a staggering growth and diversification – but the challenge remains. This brief will look at Rwanda's non-commodity merchandise exports sector and will suggest a way forward. The brief presents a new and structured way of understanding and analyzing Rwanda's performance as an exporter and insights on current and likely future trends.

## Exports and Firms Productivity

*“In 2012, 54% of merchandise exports were commodity exports (tea, coffee and minerals) and the rest were non-commodity exports (mainly agriculture products and light manufacturing)”*

Everywhere in the world, exporting firms have been found to have higher productivity levels than non-exporting firms. There are two reasons this might be the case: either the most productive firms are the ones that enter the export market, or exporting leads to “learning” and higher productivity at the firm-level. The “learning-by-exporting” hypothesis suggests that exporting firms can learn from their access to external markets, the relationships they build with external buyers, and by competing on quality and price in international markets. The learning that results from this exposure can in theory help increase productivity and foster income growth. One way of analyzing this learning process is to study two types of “discovery” dynamics: *product discovery*, when firms discover new products for which there is existing demand abroad, and *destination discovery*, when new foreign markets are found to be profitable destinations to sell existing products.

## A Quick Look at Rwanda's Non-Commodity Exports Sector<sup>1</sup>

Rwanda's non-commodity export sector is very small and has distinct characteristics from the commodity exports sector. In 2012, 54% of merchandise exports were commodity exports (tea, coffee and minerals) and the rest were non-commodity exports (mainly agriculture products and light manufacturing). However, non-commodity exports are increasing steadily, experiencing staggering growth in 2012.

Commodity and non-commodity exports differ not only in size, but also in terms of export destination. Commodities are mostly exported to the EU, America and Asia;

---

1. Non-commodity exports include all exports of products other than tea, coffee and minerals.  
2. The data in this section and in the following ones come from Gathani S., Stoelinga D., Understanding Rwanda's Agribusiness and Manufacturing Sectors, 2013; National Bank of Rwanda, Balance of Payments 1998-2012; and from Ministry of Trade and Industry, Annual Trade Report 2012.

non-commodity products are almost exclusively exported to the EAC and DRC. Non-traditional exports to the neighboring EAC and DRC accounted for 64% of Rwanda's total non-traditional exports in 2012.<sup>3</sup>

Figure 1: Breakdown of Rwanda's Exports, 2012

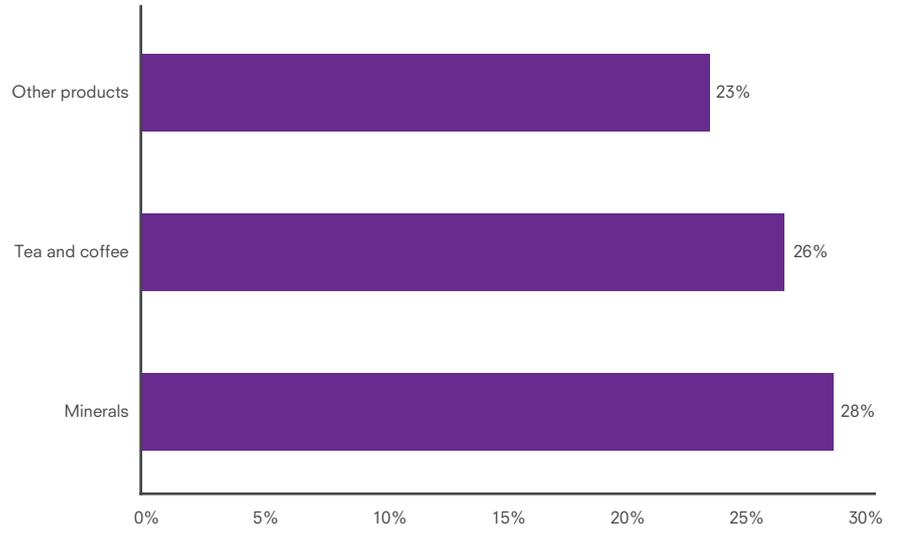

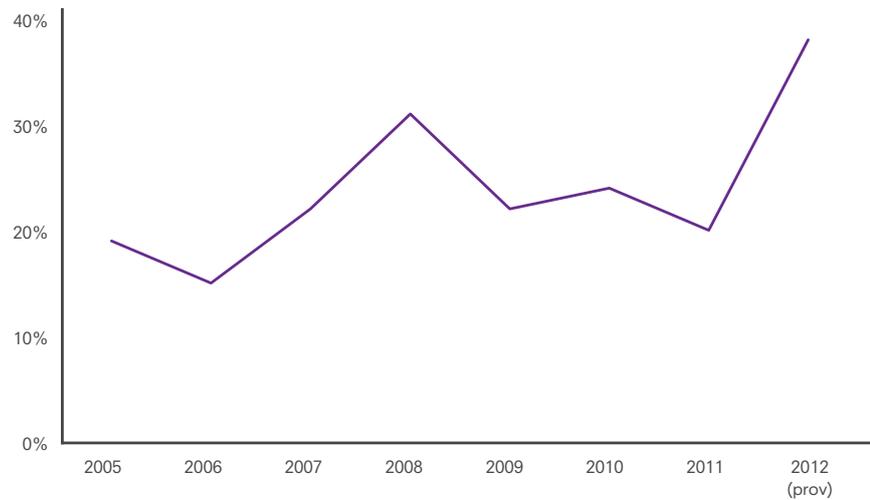

Figure 2: Share of Non-Commodities on Total Exports

*“The number of exporting firms (producers and retailers) is increasing rapidly”*

Even though the non-commodity exports sector remains small, the number of exporting firms (producers and retailers) is increasing rapidly. Since 2006, the number of firms exporting to the EAC doubled and those exporting to the DRC increased by a factor of 15. This could be a pre-cursory sign of the future growth to come in Rwanda's non-merchandise export sector.

3. This is excluding tea exports to Kenya, which transit through the Port of Mombasa to other destinations

Figure 3: Rwanda's Exports by Destination, 2012

*“Rwanda’s non-commodity exports are mainly destined to neighboring markets...in 2012, 72% of non-commodity exports went to the EAC and DRC”*

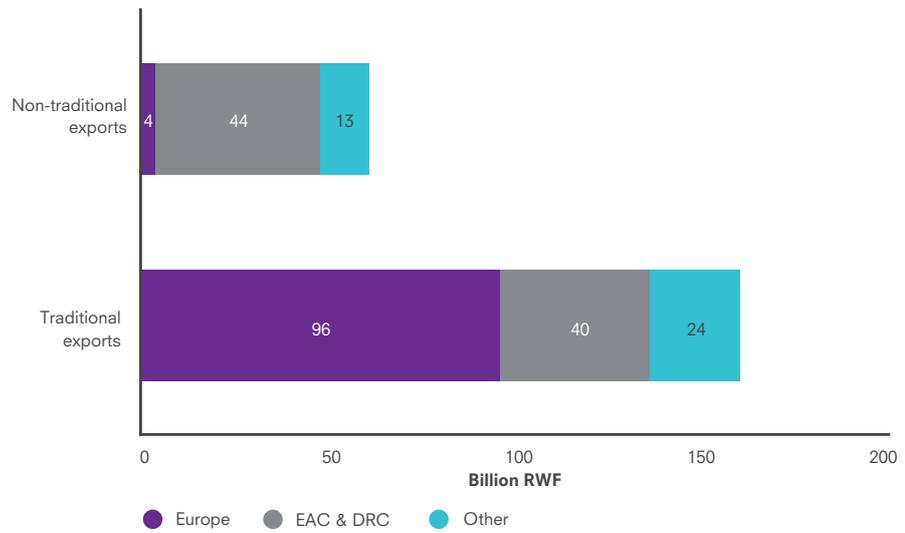

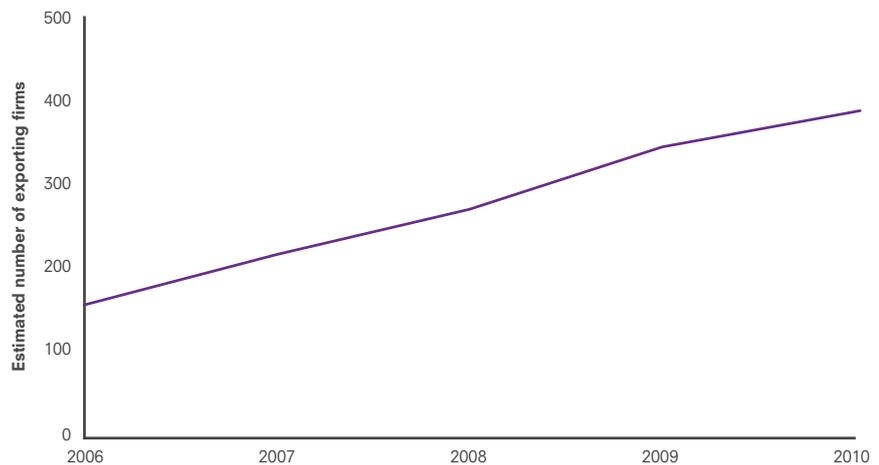

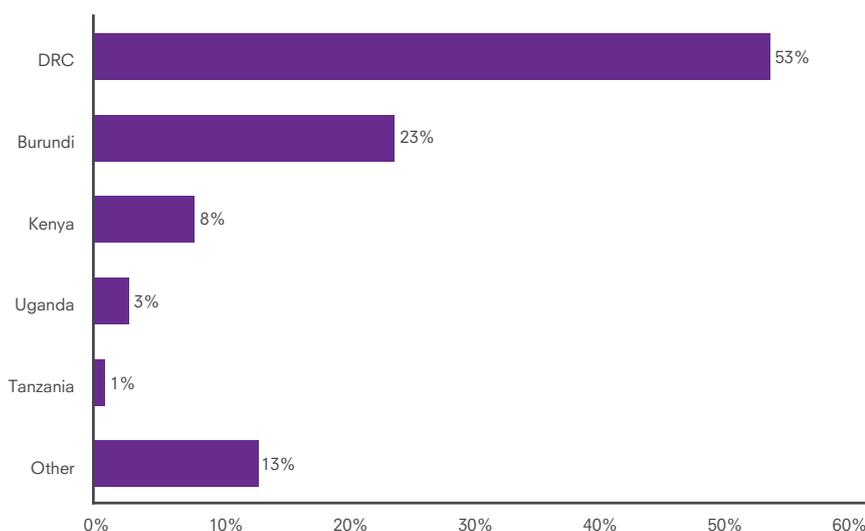

Figure 4: Estimated Number of Exporting Firms (2006-2010)

Rwanda’s non-commodity exports are mainly destined to neighboring markets. In fact, in 2012, 72% of non-commodity exports went to the EAC and DRC. These results suggest that these are the only markets where Rwanda’s manufacturing and agribusiness exports can presently compete.

Burundi and the DRC are Rwanda’s main non-commodity export destinations, accounting for 10% of total exports in 2010 (up from 1% in 2005). Official exports to the two countries have grown from about US\$1m in 2005 to US\$15.8m in 2010 (excluding re-exports). Large manufacturing firms increasingly account for the bulk of exports to the region, from an estimated 30% in 2007 to 60% in 2010.

Figure 5: Destination of Rwanda's Non-Commodity Manufacturing Exports (Average 2008-2010)

*“Product discovery is happening mostly in the commodity sector. New product discovery has contributed between 15-20% to exports growth over the past decade”*

## Drivers of Rwanda's Exports Sector

*Destination discovery* for Rwanda's non-commodity sector is limited. This is due to the comparatively low sophistication level of Rwanda's light manufacturing sector; the fact that - other than tea, coffee and pyrethrum - Rwanda does not currently grow export quality varieties (e.g. of avocados, strawberries, or other potential export crops); and high transportation costs (by air and land).

*Product discovery* is happening mostly in the commodity sector. New product discovery has contributed between 15-20% to exports growth over the past decade. The number of products exported has increased from 32 in 1996 to 350-400 today. Non-commodity exports have more than doubled as a share of total merchandise exports. Seventy percent of these discoveries (in terms of volume) have come from new product exports in the coffee (specialty coffee, roasted coffee) and minerals sectors (chromium).

Firms are entering the exports market but the export orientation of the non-commodity sector remains low. For the vast majority of manufactured products exporters, exports are not a main area of focus. The estimated export orientation of Rwanda's manufacturing sector in 2010 was only 4% of output. Learning-by-exporting opportunities appear constrained as only 3 non-commodity firms export more than 50% of their output and only a handful more than 10%. Furthermore, 76% of manufactured products are exported to Burundi and DRC, which are less developed and more volatile markets than that of Rwanda. *Therefore, the challenge for Rwandan firms is rather one of “learning to export” rather than “learning-by-exporting”.*

Firms report low capacity utilization and low productivity as key constraints to export. While firms in Rwanda's manufacturing and agribusiness sectors are

*“Future export discovery is likely to happen in the agriculture, food processing and light manufacturing sectors”*

relatively modern and well equipped – all sectors of the economy were rebuilt and retooled for more than a decade following the genocide – they suffer from low capacity utilization (on average, below 50%). One key constraint is access to raw materials, and in particular the bad quality of local inputs (especially in the agriculture sector), the lack of structure in local supply markets, and high transportation costs for inputs from abroad.

## The Way Forward for Rwanda’s Exporting Sectors

Future export discovery is likely to happen in the agriculture, food processing and light manufacturing sectors. In the short term, the export products Rwanda is the most likely to develop are mainly agriculture products such as oils and grain seeds, fruits and nuts, spices, vegetable fats, vegetable textile fibers, and edible vegetables (including peas, beans, etc). More sophisticated export products that Rwanda could promote in the medium term, include processed food and beverage products (cereals, confectionary, honey, milk, juices), wood products (wood, sawn wood, wood charcoal), construction materials (rebars, marble or other stone based construction materials), rubber products (natural rubber and inner tubes of tires), and the extraction of the essence of coffee or tea.

Expanding Rwanda’s non-commodity exports will need the following supporting measures:

1. Creating a supportive environment for larger groups – and in particular regional conglomerates – which are increasingly driving exports to the region
2. Engaging leading exporters on a regular basis to determine the policy, institutional, and economic obstacles they encounter, and exploring ways the government can support their exports through targeted efforts to improve public services and infrastructure (but stopping short of subsidies and tax breaks)
3. Facilitating the creation of more efficient and effective supply chains for raw materials through information, coordination efforts, standards, and selective infrastructure investments . As the knowledge of the Burundi and DRC markets is currently limited and demand is likely to be volatile depending on political stability and competition from the region, strategies narrowly focusing on the promotion of particular industries, firms or products appear less likely to succeed.

## About the authors

*Sachin Gathani* is the co-founder and Partner of Laterite, a research-consulting firm based in Kigali, Rwanda. Sachin studied and worked in the US and Latin America for more than 10 years before moving back to the region. He has an undergraduate degree in Political Economy and Business from the University of California, Berkeley and a Masters in International Affairs (Economic Policy & African Studies) from Columbia University.

*Dimitri Stoelinga* is the co-founder and Partner of Laterite, a research-consulting firm based in Kigali, Rwanda. He has lived and worked in more than 10 countries, including Kenya, Tanzania, Mali, Zambia, Angola, India, Indonesia and Rwanda. He studied Business at ESCP Europe and the Indian Institute of Management, and has a Masters in Public Administration in International Development from Harvard University.

*Michele Savini* is a Macroeconomist with the World Bank. Prior to this, Michele was a Country Economist for the IGC and joined the IGC Rwanda office in July 2011. Michele has also previously collaborated with the World Bank and worked as economist under the Overseas Development Institute fellowship scheme at the Ministry of Education of Ghana. For the World Bank, Michele analyzed the efficiency of public expenditures and resource distribution in the Ghanaian education sector and at the Ministry of Education of Ghana. Michele supported the development of the sector strategic plan and its implementation framework. Michele holds a Bsc and an Msc in Economics from University College London.
